

Project 1: Text Adventure

Alec Nguyen

Abstract

This Text Adventure game is based on choose your own adventure books, the goal is to try and get to the end of the story in various branching pathways. Each decision leads to different outcomes for the user's game, different locations, areas, items, and interactions within the game. If the player character dies at any point in the game they lose and must restart from the beginning, and must either learn from their mistakes, choose different options or even have luck on their side when making decisions.

Summary

Project Size: 586 lines of code

Number of variables used: 12

This project uses all the methods learned in class and the book up to this point in the class schedule. User defined functions and various loops, and switch statements are what drives this game to work.

This project took about a week to complete and debug making sure all potential scenarios worked with the different variables in the game. It was fun writing the game because I was able to add some humor instead of making it a generic fantasy setting.

Pseudo Code.

Initialize

User enters name

Introduction to game

User selects 'weapon'

User Selects path

Goes to Inn

User makes decision

User buys a room

User goes to castle

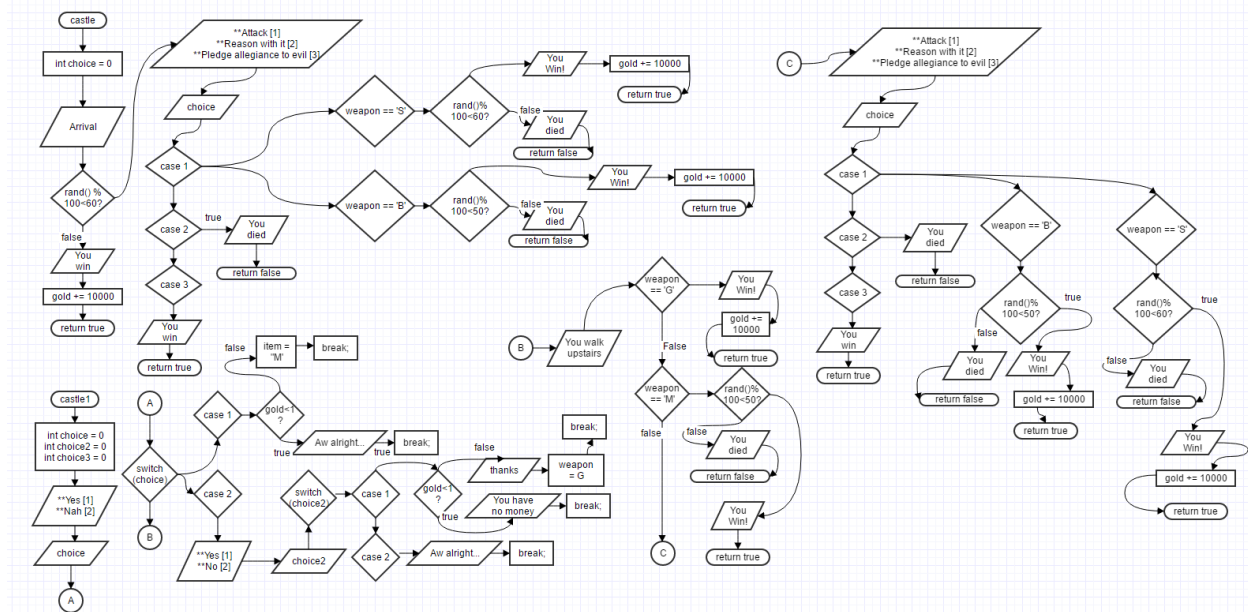

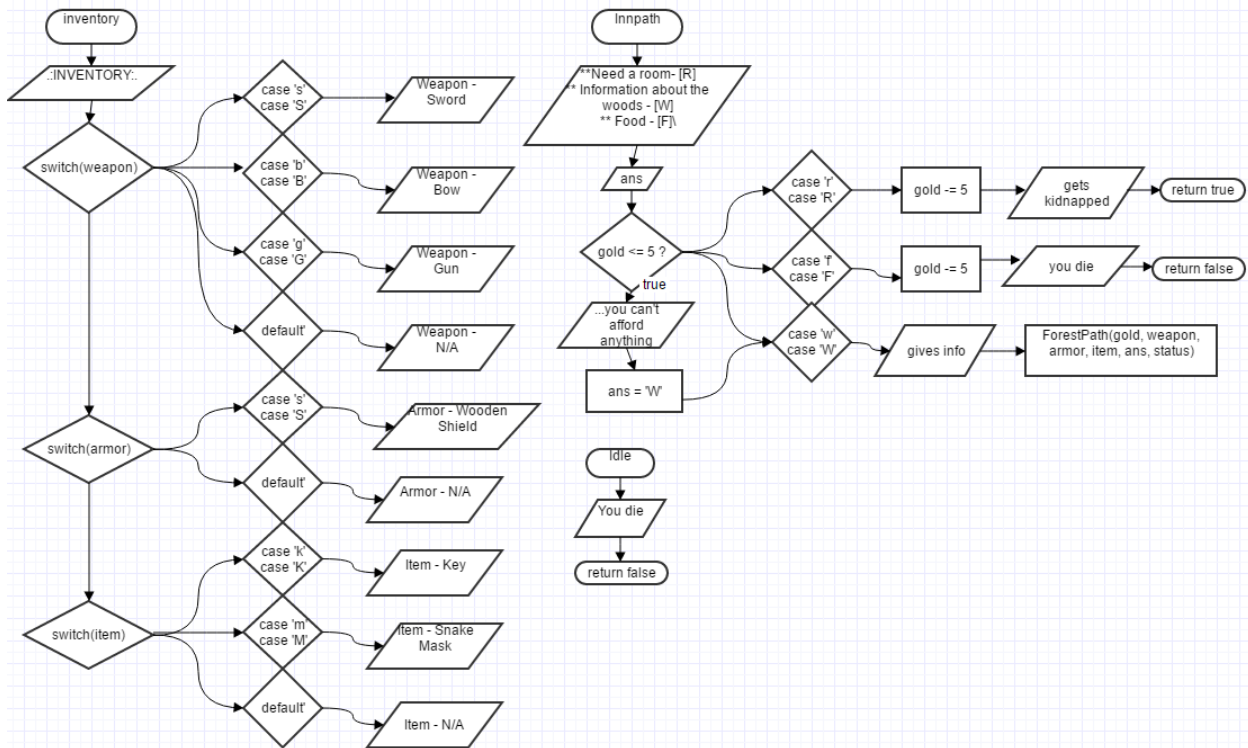

User wins or loses based on decisions

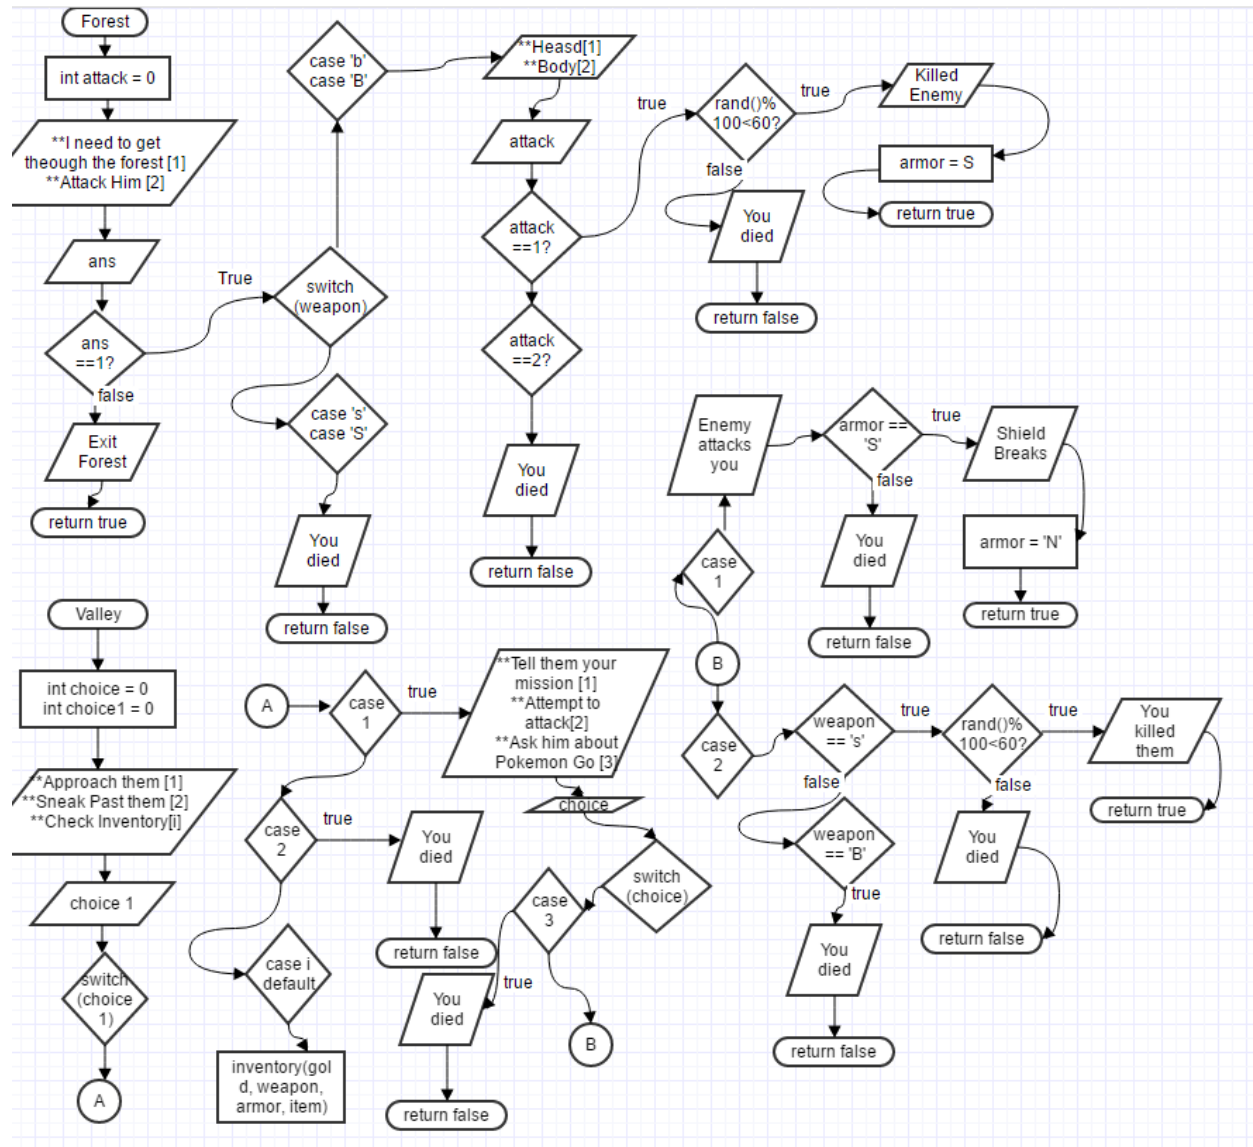

Goes to Forest

Interaction with a character

User dies

[illegible]

**Full size diagrams included in project folder*

Major Variables.

Type	Variable Name	Description	Location
Integer	gold	The amount of gold the player has.	int main() void inventory() bool InnPath() bool ForestPath() bool Idle() bool valley() bool castle() bool castle1()

	attack	Attack choice	bool ForestPath()
	choice	User choice in various functions.	bool valley() bool castle() bool castle1()
	choice1	User choice in various functions.	bool valley()
	choice2	User choice in various functions.	bool castle1()
	choice3	User choice in various functions.	bool castle1()
Bool	<i>status</i>	If status is true the player is alive and false if dead.	int main() bool InnPath() bool ForestPath() bool Idle() bool valley() bool castle() bool castle1()
char	name[20]	User inputted name	int main()
	weapon	Player weapon, weapon is changed based on player decisions.	int main() void inventory() bool InnPath() bool ForestPath() bool Idle() bool valley() bool castle() bool castle1()
	armor	Player armor, is changed based on player decisions.	int main() void inventory() bool InnPath() bool ForestPath()

		bool Idle()
		bool valley()
		bool castle()
		bool castle1()
item	Player item, is changed based on player decisions.	int main()
		void inventory()
		bool InnPath()
		bool ForestPath()
		bool Idle()
		bool valley()
		bool castle()
		bool castle1()
ans	Response when prompted a question in game.	int main()
		void inventory()
		bool InnPath()
		bool ForestPath()
		bool Idle()
		bool valley()
		bool castle()
		bool castle1()
tryagain	Prompts user to restart the game.	int main()

C++ Constructs.

Contract	Location
----------	----------

srand(time(NULL))	int main()
Array	name[20]
do-while loops	int main()
switch statements	int main()
